11 Importing an assembly

11.1 Procedure -Importing a module

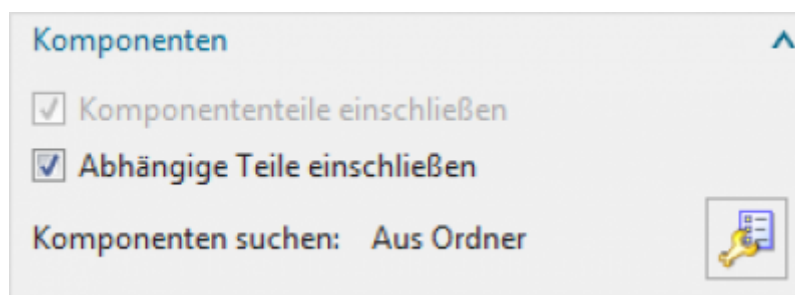

1. on the File tab, select →  **Import assembly into Teamcenter.**

Select **FFG Engineering Item** from the **Default Settings** group in the **Item Type** list.

In the **Components** group, select the following:

- * Include Component Parts
- * Include dependent parts

Tip:

If you also import component parts and dependent parts, you must select the **Include component parts and Include dependent parts** check boxes before you select the assemblies to import.

|@red: | |@red: |Note:

The import of an assembly with drawings takes place via the same procedure → the import function recognizes whether a UGPart (drawing) exists for the UGMaster (model). This is automatically linked → the relationship type of the UGMaster is “master” and the drawing is “specification”.

Caution:**

Occasionally it happens that the old document number is stored as ID during the import → This can then be assigned manually according to the prescribed number range. A solution is being worked on.

How the import of assemblies is to be mapped processually with GoLive from Teamcenter still has to be defined. (Keyword: Duplicates).
