11 Importing an assembly

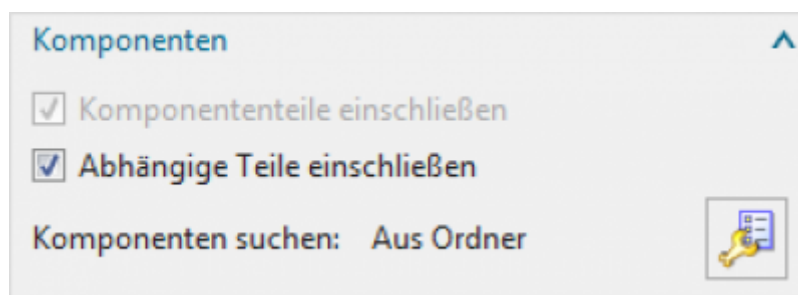

11.1 Procedure -Importing a module

1. on the File tab, select →  **Import assembly into Teamcenter**.
2. Select **FFG Engineering Item** from the **Default Settings** group in the **Item Type** list.

3. In the **Components** group, select the following:

- * Include Component Parts
- * Include dependent parts

Note:

The import of an assembly with drawings takes place via the same procedure → the import function recognizes whether a UGPart (drawing) exists for the UGMaster (model). This is automatically linked → the relationship type of the UGMaster is „master“ and the drawing is „specification“.

Caution:

Occasionally it happens that the old document number is stored as ID during the import → This can then be assigned manually according to the prescribed number range. A solution is being worked on.

How the import of assemblies is to be mapped processually with GoLive from Teamcenter still has to be defined. (Keyword: Duplicates).
